Chapter 5, Analysis: Dynamic Modeling
Ways to Go

- System design (Ch. 6 & 7)
- Subsystem Decomposition
- Object design (Ch. 8 & 9)
- Class Diagram
- Object Design Model
- Source Code
- Implementation (Ch. 10)
- Testing (Ch. 11)
- Deliverable System
Outline of the Lecture

• Dynamic modeling
  • Interaction Diagrams
    • Sequence diagrams
    • Communication diagrams
  • State diagrams
• Requirements analysis model validation
• Analysis Example
Dynamic Modeling with UML

- Two UML diagrams types for describing dynamic models:
  - Statechart diagrams describe the dynamic behavior of a single object
  - Interaction diagrams describe the dynamic behavior between objects.
UML Interaction Diagrams

• Two types of interaction diagrams:
  • Communication Diagram:
    • Shows the temporal relationship among objects
    • Position of objects is identical to the position of the classes in the corresponding UML class diagram
    • Good for identifying the protocol between objects
    • Does not show time
  • Sequence Diagram:
    • Describes the dynamic behavior between several objects over time
    • Good for real-time specifications.
How do we detect Operations?

• We look for objects, who are interacting and extract their “protocol”
• We look for objects, who have interesting behavior on their own
• Good starting point: Flow of events in a use case description
• From the flow of events we proceed to the sequence diagram to find the participating objects.
How do we detect Operations?

• We look for objects, who are interacting and extract their “protocol”
• We look for objects, who have interesting behavior on their own
• Good starting point: Flow of events in a use case description
• From the flow of events we proceed to the sequence diagram to find the participating objects.
What is an Event?

• Something that happens at a point in time
• An event sends information from one object to another
• Events can have associations with each other:
  • Causally related:
    • An event happens always before another event
    • An event happens always after another event
  • Causally unrelated:
    • Events that happen concurrently
• Events can also be grouped in event classes with a hierarchical structure => Event taxonomy.
Events hierarchy

- «signal» InputEvent
  - time
  - abstract signal

- «signal» UserInput
  - device

- «signal» Mouse Button
  - location

- «signal» Keyboard Character
  - character

- «signal» Mouse Button Down
  - concrete signals

- «signal» Mouse Button Up

- «signal» Control Character

- «signal» Graphic Character

- «signal» Space

- «signal» Alphanumeric

- «signal» Punctuation
Finding Participating Objects

• Heuristic for finding participating objects:
  • A event always has a sender and a receiver
  • Find the sender and receiver for each event => These are the objects participating in the use case.
Example: Finding Objects from a Sequence Diagram

- Let’s assume ARENA’s object model contains – at this modeling stage – the following six objects
  - League Owner, League, Tournament, Match and Player

```
<table>
<thead>
<tr>
<th>League Owner</th>
<th>1</th>
<th>League</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td></td>
<td>Attributes</td>
</tr>
<tr>
<td>Operations</td>
<td></td>
<td>Operations</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tournament</th>
<th>1</th>
<th>Match</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td></td>
<td>Attributes</td>
</tr>
<tr>
<td>Operations</td>
<td></td>
<td>Operations</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Player</th>
<th>*</th>
<th>Match</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td></td>
<td>Attributes</td>
</tr>
<tr>
<td>Operations</td>
<td></td>
<td>Operations</td>
</tr>
</tbody>
</table>
```

```
Example: Finding Objects from a Sequence Diagram

• Let’s assume ARENA’s object model contains – at this modeling stage – the following six objects
  League Owner, League, Tournament, Match and Player

• We now model the use case CreateTournament with a sequence diagram
ARENA Sequence Diagram: Create Tournament

League Owner

newTournament(league)

setNome(name)

setMaxPlayers(maxp)

commit()

createTournament(name, maxp)

checkMaxTournament()

createTournament(name, maxp)

«new» Tournament

:Announce Tournament Control

Tournament
Heuristics for Sequence Diagrams

• **Layout:**
  1st column: Should be the *actor* of the use case
  2nd column: Should be a *boundary object*
  3rd column: Should be the *control object* that manages the rest of the use case

• **Creation of objects:**
  • Create control objects at beginning of event flow
  • The control objects create the boundary objects

• **Access of objects:**
  • Entity objects can be accessed by control and boundary objects
  • Entity objects should not access boundary or control objects.
Another Example: Finding Objects from a Sequence Diagram

The Sequence Diagram identified 3 new Classes
- Tournament Boundary, Announce_Tournament_Control and Arena
**ARENA Sequence Diagram: Create Tournament**

```
League Owner

newTournament (league)

Tournament Boundary

«new»

Announce Tournament Control

checkMax Tournament()

create Tournament (name, maxp)

Arena

League

setMaxPlayers (maxp)

setName(name)

commit()

create Tournament (name, maxp)

```

Bernd Bruegge & Allen H. Dutoit

Object-Oriented Software Engineering: Using UML, Patterns, and Java
Impact on Arena’s Object Model

- **League**
  - Attributes
  - Operations

- **Owner**
  - Attributes
  - Operations

- **Arena**
  - Attributes
  - Operations

- **Tournament**
  - Attributes
  - Operations

- **Tournament Boundary**
  - Attributes
  - Operations

- **Announce Tournament Control**
  - Attributes
  - Operations

- **Player**
  - Attributes
  - Operations

- **Match**
  - Attributes
  - Operations

- **League**
  - Attributes
  - Operations

- **Owner**
  - Attributes
  - Operations
Impact on ARENA’s Object Model (2)

- The sequence diagram also supplies us with many new events
  - newTournament(league)
  - setName(name)
  - setMaxPlayers(max)
  - commit
  - checkMaxTournament()
  - createTournament

- Question:
  - Who owns these events?
- Answer:
  - For each object that receives an event there is a public operation in its associated class
  - The name of the operation is usually the name of the event.
Example from the Sequence Diagram

League Owner

newTournament (league)

setName(name)

setMaxPlayers (maxp)

commit()

createTournament (name, maxp)

checkMax Tournament()

create Tournament (name, maxp)

Announce Tournament Control

Tournament

:League

:Arena

:Boundary

League

Owner

newTournament (league)
League Owner
- Attributes
- Operations

League
- Attributes
- Operations

Tournament_Boundary
- Attributes
- Operations

createTournament
  (name, maxp)

Announce_Tournament_Control
- Attributes
- Operations

Tournament
- Attributes
- Operations

Player
- Attributes
- Operations

Match
- Attributes
- Operations

Arena
- Attributes
- Operations
What else can we get out of Sequence Diagrams?

- Sequence diagrams are derived from use cases

- The structure of the sequence diagram helps us to determine how decentralized the system is

- We distinguish two structures for sequence diagrams
  - *Fork Diagrams* and *Stair Diagrams* (Ivar Jacobsen)
Fork Diagram

- The dynamic behavior is placed in a single object, usually a control object
  - It knows all the other objects and often uses them for direct questions and commands
Stair Diagram

- The dynamic behavior is distributed. Each object delegates responsibility to other objects.
  - Each object knows only a few of the other objects and knows which objects can help with a specific behavior.
Fork or Stair?

- Object-oriented supporters claim that the stair structure is better.

Modeling Advice:
- Choose the stair - a decentralized control structure - if:
  - The operations have a strong connection
  - The operations will always be performed in the same order
- Choose the fork - a centralized control structure - if:
  - The operations can change order
  - New operations are expected to be added as a result of new requirements.
State

- **State**: An abstraction of the attributes of a class
  - State is the aggregation of several attributes a class
- State has duration.
State Chart Diagram vs Sequence Diagram

- State chart diagrams help to identify:
  - Changes to an individual object over time

- Sequence diagrams help to identify:
  - The temporal relationship of between objects over time
  - Sequence of operations as a response to one or more events.
Dynamic Modeling of User Interfaces

- Statechart diagrams can be used for the design of user interfaces
- States: Name of screens
- Actions are shown as bullets under the screen name
Navigation Path Example

- **Screen name**
  - Diagnostics Menu
    - User moves cursor to Control Panel or Graph

- **Control panel**
  - User selects functionality of sensors

  - **Define**
    - User defines a sensor event from a list of events

  - **Enable**
    - User can enable a sensor event from a list of sensor events

  - **Disable**
    - User can disable a sensor event from a list of sensor events

- **Graph**
  - User selects data group and type of graph

  - **Selection**
    - User selects data group
      - Field site
      - Car
      - Sensor group
      - Time range

NOT a good UML diagram! Syntax not respected
Outline of the Lecture

• Dynamic modeling
  • Interaction Diagrams
    • Sequence diagrams
    • Communication diagrams
  • State diagrams

Requirements analysis model validation
• Analysis Example
Model Validation and Verification

- **Verification** is an equivalence check between the transformation of two models
- **Validation** is the comparison of the model with reality
  - Validation is a critical step in the development process. Requirements should be validated with the client and the user.
  - Techniques: Formal and informal reviews (Meetings, requirements review)
- **Requirements validation** involves several checks
  - Correctness, Completeness, Ambiguity, Realism
Checklist for a Requirements Review

- Is the model **correct**?
  - A model is correct if it represents the client’s view of the system
- Is the model **complete**?
  - Every scenario is described
- Is the model **consistent**?
  - The model does not have components that contradict each other
- Is the model **unambiguous**?
  - The model describes one system, not many
- Is the model **realistic**?
  - The model can be implemented
Examples for Inconsistency and Completeness Problems

- Different spellings in different UML diagrams
- Omissions in diagrams
Different spellings in different UML diagrams

UML Sequence Diagram

createTournament (name, maxp)

  - Operations

Missing class (The control object Announce_Tournament is mentioned in the sequence diagram)

Missing Association (Incomplete Analysis?)
Checklist for a Requirements Review (2)

• Syntactical check of the models
• Check for consistent naming of classes, attributes, methods in different subsystems
• Identify dangling associations (“pointing to nowhere”)
• Identify double-defined classes
• Identify missing classes (mentioned in one model but not defined anywhere)
• Check for classes with the same name but different meanings
Requirements Analysis Document Template

1. Introduction
2. Current system
3. Proposed system
   3.1 Overview
   3.2 Functional requirements
   3.3 Nonfunctional requirements
   3.4 Constraints (“Pseudo requirements”)
   3.5 System models
      3.5.1 Scenarios
      3.5.2 Use case model
      3.5.3 Object model
         3.5.3.1 Data dictionary
         3.5.3.2 Class diagrams
      3.5.4 Dynamic models
      3.5.5 User interface
4. Glossary
Section 3.5 System Models

3.5.1 Scenarios
- As-is scenarios, visionary scenarios

3.5.2 Use case model
- Actors and use cases

3.5.3 Object model
- Data dictionary
- Class diagrams (classes, associations, attributes and operations)

3.5.4 Dynamic model
- State diagrams for classes with significant dynamic behavior
- Sequence diagrams for collaborating objects (protocol)

3.5.5 User Interface
- Navigational Paths, Screen mockups
1. What are the transformations?  
   Create *scenarios and use case diagrams*
   - Talk to client, observe, get historical records

2. What is the structure of the system?  
   Create *class diagrams*
   - Identify objects.
   - What are the associations between them?
   - What is their multiplicity?
   - What are the attributes of the objects?
   - What operations are defined on the objects?

3. What is its behavior?  
   Create *sequence diagrams*
   - Identify senders and receivers
   - Show sequence of events exchanged between objects.
   - Identify event dependencies and event concurrency.

   Create *state diagrams*
   - Only for the dynamically interesting objects.
Let’s Do Analysis: A Toy Example

• Analyze the problem statement
  • Identify functional requirements
  • Identify nonfunctional requirements
  • Identify constraints (pseudo requirements)

• Build the functional model:
  • Develop use cases to illustrate functional requirements

• Build the dynamic model:
  • Develop sequence diagrams to illustrate the interaction between objects
  • Develop state diagrams for objects with interesting behavior

• Build the object model:
  • Develop class diagrams for the structure of the system
Problem Statement: Direction Control for a Toy Car

- Power is turned on
  - Car moves forward and car headlight shines
- Power is turned off
  - Car stops and headlight goes out.
- Power is turned on
  - Headlight shines
- Power is turned off
  - Headlight goes out
- Power is turned on
  - Car runs backward with its headlight shining

- Power is turned off
  - Car stops and headlight goes out
- Power is turned on
  - Headlight shines
- Power is turned off
  - Headlight goes out
- Power is turned on
  - Car runs forward with its headlight shining
Find the Functional Model: Use Cases

- **Use case 1: System Initialization**
  - Entry condition: Power is off, car is not moving
  - Flow of events:
    1. Driver turns power on
  - Exit condition: Car moves forward, headlight is on

- **Use case 2: Turn headlight off**
  - Entry condition: Car moves forward with headlights on
  - Flow of events:
    1. Driver turns power off, car stops and headlight goes out.
    2. Driver turns power on, headlight shines and car does not move.
    3. Driver turns power off, headlight goes out
  - Exit condition: Car does not move, headlight is out
Use Cases continued

- **Use case 3: Move car backward**
  - Entry condition: Car is stationary, headlights off
  - Flow of events:
    1. Driver turns power on
  - Exit condition: Car moves backward, headlight on

- **Use case 4: Stop backward moving car**
  - Entry condition: Car moves backward, headlights on
  - Flow of events:
    1. Driver turns power off, car stops, headlight goes out.
    2. Power is turned on, headlight shines and car does not move.
    3. Power is turned off, headlight goes out.
  - Exit condition: Car does not move, headlight is out
Use Cases Continued

- **Use case 5: Move car forward**
  - Entry condition: Car does not move, headlight is out
  - Flow of events
    1. Driver turns power on
  - Exit condition:
    - Car runs forward with its headlight shining
Use Case Pruning

• Do we need use case 5?
• Let us compare use case 1 and use case 5:

Use case 1: System Initialization
• Entry condition: Power is off, car is not moving
• Flow of events:
  1. Driver turns power on
• Exit condition: Car moves forward, headlight is on

Use case 5: Move car forward
• Entry condition: Car does not move, headlight is out
• Flow of events
  1. Driver turns power on
• Exit condition:
  • Car runs forward with its headlight shining
Dynamic Modeling: Create the Sequence Diagram

- Name: Drive Car
- Sequence of events:
  - Billy turns power on
  - Headlight goes on
  - Wheels starts moving forward
  - Wheels keeps moving forward
  - Billy turns power off
  - Headlight goes off
  - Wheels stops moving
  - . . .
Sequence Diagram for Drive Car Scenario
